

Frozen Seven-Arm Local Subprocess Report

Status: local synthetic contract complete; true official grade externally blocked.

The exact seven frozen packages were executed as separate processes on the bundle's deterministic seed-51000 synthetic contract. The official **whetbench** package, FlopScope runtime, official cohort and parquet data were not available, so these measurements must not be represented as an official score or deployment-cost comparison.

Arm	Algorithm time (s)	Process wall (s)	Peak RSS (MiB)	Output relation
production_baseline	64.248	64.99	2115.4	production reference
A42	25.671	26.28	532.8	A42/A43-identical full output
A43	27.153	27.79	532.6	A42/A43-identical full output
A43_delta64	25.346	25.97	533.1	A42/A43-identical full output
A43_basis096	18.832	19.47	442.9	partial-basis output
A43_basis064	12.813	13.38	386.5	partial-basis output
A43_basis032	5.965	6.55	331.1	partial-basis output

Numerical parity

- A42 and A43 were bit-identical: **True**.
- A42/A43 versus production RMS drift: **1.54805472474e-07**.
- Relative RMS drift: **2.55482701043e-07**.

Decision

Retain production as the externally verified package. A42 was the fastest full-width arm in this single synthetic local run and A42/A43 were bit-identical, but official promotion remains blocked on the missing grader, FlopScope, cohort and raw-MSE/effective-cost comparison.

The partial-basis runtimes confirm the expected cost ordering but do not alter the prior statistical conclusion that 129 bases is the standalone design.
